

AI Engineer: agents & automation

Freelance / contractor · Fully remote · India-based team

About the company

International Media Company B.V. (IMC) is part of the Sansyl Group, a media business established in 1968. The group produces and licenses video, film and TV content, and operates across websites, TV channels, apps and magazines. Alongside content, we also run hosting, billing and regular publications. The group has locations in the Netherlands and Romania, and a growing content team in India.

Group website	sansylgroup.com
Main platform	AdultPrime.com
Head office	The Netherlands

Part of what we run is adult (18+) content, and our main platform is a large adult media brand. We're open about that from the first conversation, because we'd rather you decide with the full picture. There's a separate note on this further down.

The role in one paragraph

You'd build and maintain the AI agents, workflows and automations behind our content and social operation. This is a backend engineering role: you build the systems, and other people create and manage the content. Right now much of this work is manual, so there's a lot of room for someone who enjoys turning a messy process into something that runs by itself.

What you'd build

- AI agents and multi-step workflows that handle repetitive parts of our content operation.
- Content pipelines: taking source material and producing platform-ready output at volume.
- Publishing and scheduling automations across multiple social platforms and accounts.
- Integrations that connect different platforms, tools and data sources through their APIs.
- Small internal tools and reporting so we can see what's working without digging through dashboards.
- Keeping all of the above running reliably, unattended, and at a sensible cost.

Tech stack

Primarily Python, LLM APIs (OpenAI, Anthropic), and agent or orchestration frameworks such as LangChain and LangGraph. Depending on the task, also RAG, automation tooling such as n8n, and plenty of API integration work. We're not dogmatic about specific tools: we care much more about systems that are clean, reliable and cheap to run than about which framework they're built with. If you have a better way to do something, we want to hear it.

Who you'd work with

A deliberately small team. You'd work directly with the founder, alongside a handful of editors and social media managers, and a technical colleague handling infrastructure. Short lines, no layers, decisions made quickly. English is the working language across the team.

Practical details

Engagement	Freelance / contractor, not employment. You invoice every two weeks and handle your own taxes, working independently.
------------	---

Location	Fully remote.
Hours	Full-time preferred (around 40 hours/week). Part-time is possible for the right person.
Working times	Roughly 9 to 5 India time. We're in the Netherlands, so there's good overlap.
Compensation	₹75,000 to ₹1,60,000 per month, depending on experience. Paid every two weeks.
Payment method	Wise (bank transfer or UPI), Paxum or MassPay.
Agreement	A written contract before you start, covering scope, payment, IP and confidentiality.
Growth	We care about results rather than years of experience. Strong performers move up into higher rates and more responsibility.

How the process works

- 1 A short conversation, so you can ask whatever you want and we can talk through your work.
- 2 A short **paid** trial task, a few hours, paid on completion regardless of the outcome. You get a separate brief for it.
- 3 If it's a fit both ways, we sign the contract and you start.

The trial exists because we think it's a fairer test than an interview, in both directions: you see how we work, we see how you build.

Working with our material

Worth being clear about, so it's never a surprise later. Because part of our content is adult, you would regularly see that material while building, testing and debugging these systems. You would not be creating, selecting or posting content, but it does pass in front of you as part of normal day-to-day work.

It's important to us that this is genuinely fine for you, not just something you're willing to tolerate. If it isn't, that's a completely reasonable answer and no hard feelings, and better said now than three months in.

Your privacy is respected. On your CV and to anyone outside, this is simply an AI and automation engineering role at a media company.

Questions are welcome at any point in the process, including before the trial.
